

## Enhanced Processing Speed on main Project Screen

In an effort to increase processing speed while working within a Contract Job or Contract Quote, Software for Hardware, LLC has improved the “behind the scenes” efficiency and functionality of the main *Project* screen.

### Enhancements:

1. The main *Project* grid is only reloaded and sorted when a change is made to an opening. In the past the grid was reloaded and sorted whenever returning from a linked program such as *Search & Replace Doors*. On jobs with hundreds or thousands of openings, this was a timely and painful process to endure.
2. If a change is made on the *General, Door, Frame or Prehung* tabs only the grid rows containing the changed openings are reloaded and resorted. In the past the entire grid was reloaded and sorted. Again, on jobs with hundreds or thousands of openings, this was a timely and painful process to endure.
3. All *Search & Replace* programs have been redesigned to load very quickly. In the past loading every drop down box on both sides of the screen could take some time depending upon the number of openings and the number of manufacturers used in the job. Also, if no changes are made then upon exit the *Project* grid is not reloaded and sorted – in the past it was regardless if a change was made or not made.
4. Other miscellaneous modifications to help enhance speed and efficiency.
